

AI Training App Prompt: Personalized 2.5-Year Planche & Front Lever Mastery

Objective

Develop a highly personalized, mobile-first web application that serves as a dedicated training coach for a 16-year-old user (175cm, 70kg). The app's sole purpose is to guide the user through a 2.5-year program to achieve and master the Full Planche and Full Front Lever. The application must implement precise, automatic progressive overload, micro-progression techniques, and periodization, ensuring continuous, safe, and efficient progress towards these specific calisthenics skills and an athletic physique. The UI/UX must be clean, intuitive, and optimized for mobile use, avoiding any unnecessary features or clutter.

User Profile & Current Abilities

- **Age:** 16 years old
- **Height:** 175 cm
- **Weight:** 70 kg
- **Overall Goal:** Achieve Full Planche and Full Front Lever within 2.5 years, then master both skills.
- **Current Calisthenics Abilities:**
 - **Pull-ups:** 15 repetitions
 - **Muscle-ups:** 3 repetitions (not performable at home)
 - **Push-ups:** 48 repetitions
 - **Planche Progression:** Tuck Planche on fingers (cannot yet perform Advanced Tuck Planche)
 - **Front Lever Progression:** Advanced Tuck Front Lever Raises
 - **Other Skills:** Dragon Flag (not performable at home)

Core Principles of the Training Program

1. **Hyper-Personalization:** The app is exclusively for this user. All programming decisions, feedback, and UI elements must reflect this singular focus.
2. **Mobile-First Design:** The primary interface must be optimized for smartphones, ensuring ease of use during workouts (e.g., large buttons, minimal text input, clear

visuals).

3. **Skill-Centric Progression:** All training revolves around the specific, sequential progressions for Planche and Front Lever.
4. **Automatic & Intelligent Progressive Overload:** The app must dynamically adjust training variables based on real-time user performance, ensuring optimal challenge without plateaus.
5. **Micro-Progression:** Implement granular steps to bridge the gaps between major progressions, crucial for bodyweight skills.
6. **Periodization:** Utilize a non-linear periodization model over the 2.5-year macrocycle, with planned deloads.
7. **Balanced Development:** Integrate targeted accessory exercises that build foundational strength, address weak points, and contribute to an athletic physique, complementing skill work.
8. **Injury Prevention:** Emphasize proper form, warm-ups, cool-downs, and a clear mechanism for reporting and responding to pain.
9. **Equipment Adaptability:** The program must account for limited home equipment (e.g., no muscle-up bar or dragon flag setup at home), prioritizing exercises that can be done with minimal equipment (floor, pull-up bar, parallettes if available).

2.5-Year Macrocycle Structure & Skill Stages

The AI app will structure the training into a 2.5-year macrocycle, clearly defining 4 stages for each skill. The app's UI should visually represent these stages as distinct pages or levels, with clear progress indicators.

Planche Progression (4 Stages)

1. **Stage 1: Tuck & Advanced Tuck Planche (Approx. Months 1-6)**
 - **Goal:** Achieve a consistent 15-20 second Tuck Planche hold (on fingers) and progress to a 5-10 second Advanced Tuck Planche hold (back flat, hips away from hands).
 - **Focus:** Building foundational straight-arm pushing strength, shoulder protraction, and bicep tendon conditioning.
 - **Key Accessory Exercises:** Pseudo Planche Push-ups (PPPU) with increasing lean, Planche Leans (tuck position), Scapular Push-ups, Hollow Body Holds.
2. **Stage 2: Straddle Planche (Approx. Months 7-15)**

- **Goal:** Achieve a consistent 5-10 second Straddle Planche hold with perfect form (straight arms, protracted shoulders, flat back, legs straddled).
- **Focus:** Increasing leverage strength, shoulder stability, and core engagement in a wider body position.
- **Key Accessory Exercises:** Straddle Planche Leans, Band-assisted Straddle Planche holds (progressing to thinner bands), Weighted Dips (if equipment available, otherwise harder PPPU variations), Planche Negatives (tuck to straddle).

3. Stage 3: Full Planche (Approx. Months 16-24)

- **Goal:** Achieve a 3-5 second Full Planche hold (legs together, straight body).
- **Focus:** Closing the leg angle, maximizing straight-arm strength and full-body tension.
- **Key Accessory Exercises:** Full Planche Eccentrics (negatives), Advanced PPPU variations (extreme lean, elevated feet), Planche Presses (from tuck/straddle to handstand), Weighted Planche Leans (if possible).

4. Stage 4: Mastering Full Planche (Approx. Months 25-30)

- **Goal:** Achieve a consistent 10+ second Full Planche hold, perform multiple sets, and integrate dynamic elements (e.g., Planche to Handstand transitions).
- **Focus:** Endurance, stability, and dynamic control in the Full Planche.
- **Key Accessory Exercises:** Sustained Full Planche holds, Planche push-ups, various Planche transitions.

Front Lever Progression (4 Stages)

1. Stage 1: Advanced Tuck to One-Leg Front Lever (Approx. Months 1-6)

- **Goal:** Achieve a consistent 15-20 second Advanced Tuck Front Lever hold and progress to a 5-10 second One-Leg Front Lever hold.
- **Focus:** Building foundational straight-arm pulling strength, shoulder retraction, and core strength.
- **Key Accessory Exercises:** Front Lever Raises (Advanced Tuck), Front Lever Rows (Advanced Tuck), Scapular Pulls, Hollow Body Holds, Hanging Leg Raises.

2. Stage 2: Straddle Front Lever (Approx. Months 7-15)

- **Goal:** Achieve a consistent 10-15 second Straddle Front Lever hold with perfect form (straight arms, retracted shoulders, flat back, legs straddled).
- **Focus:** Increasing leverage strength, back engagement, and core stability in a wider body position.

- **Key Accessory Exercises:** Straddle Front Lever Rows, Band-assisted Straddle Front Lever holds (progressing to thinner bands), Ice Cream Makers, Weighted Pull-ups (if equipment available, otherwise harder pull-up variations).

3. Stage 3: Full Front Lever (Approx. Months 16-24)

- **Goal:** Achieve a 5-10 second Full Front Lever hold (legs together, straight body).
- **Focus:** Closing the leg angle, maximizing straight-arm pulling strength and full-body tension.
- **Key Accessory Exercises:** Full Front Lever Negatives, Weighted Pull-ups (heavier), Straight Arm Pulldowns (band or cable), Dragon Flags (if equipment allows).

4. Stage 4: Mastering Full Front Lever (Approx. Months 25-30)

- **Goal:** Achieve a consistent 15+ second Full Front Lever hold, perform multiple sets, and integrate dynamic elements (e.g., Front Lever Pull-ups).
- **Focus:** Endurance, stability, and dynamic control in the Full Front Lever.
- **Key Accessory Exercises:** Sustained Full Front Lever holds, Front Lever Pull-ups, various Front Lever transitions.

Automatic Progressive Overload Algorithms (Mobile-First Logic)

The AI app must implement the following algorithms to dynamically adjust training parameters. All logging should be via simple taps or minimal input on a mobile screen.

1. Isometric Holds (Planche & Front Lever Progressions)

Input Variables: Exercise_Name , Last_Performance_Hold_Time_Seconds , Max_Hold_Time_Achieved_Seconds (user's current maximal hold for that progression).

Prilepin Table for Isometrics (Internal Reference - Not displayed to user):

Max Hold (s)	Hold Time per Set (60-70% of Max)	Total Volume (s)	Recommended Sets
4 - 7s	3 - 4s	24 - 32s	6 - 8
8 - 12s	5 - 8s	36 - 48s	5 - 7
13 - 18s	9 - 12s	48 - 60s	4 - 6
19 - 25s	13 - 18s	60 - 75s	3 - 5

26 - 35s

19 - 25s

75 - 90s

3 - 4

Logic Flow for Next Workout Calculation:

1. **Max Hold Retest:** The app will prompt the user to perform a maximal hold for their current progression every 4 weeks, or if they consistently exceed the upper range of their `Target_Hold_Time_Range_Seconds`. This updates `Max_Hold_Time_Achieved_Seconds`.
2. **Determine Target Hold Parameters:** Based on the updated `Max_Hold_Time_Achieved_Seconds`, the app will consult the Prilepin Table to determine the `Target_Hold_Time_Range_Seconds` (60-70% of max hold) and `Recommended_Sets` for the current exercise.
3. **Micro-Progression (Hold Time):** If the `Last_Performance_Hold_Time_Seconds` for a given set was at the upper end of the `Target_Hold_Time_Range_Seconds` for 2-3 consecutive sessions, the app will increase the `Hold_Time_per_Set` by 1 second for the next session. This increase must remain within the `Target_Hold_Time_Range_Seconds`.
4. **Progression to Next Skill Variation:** Once the user consistently achieves the `Target_Hold_Time_per_Set` for the maximum `Recommended_Sets` (e.g., 5 sets of 10-12s) for 2-3 consecutive sessions, the app will automatically suggest attempting the next harder progression (e.g., from Tuck Planche to Advanced Tuck Planche). The `Max_Hold_Time_Achieved_Seconds` for the new, harder progression will be initialized to a low value (e.g., 3-5s).
5. **Volume/Intensity Adjustment (Regression):** If the user reports failure to meet the `Target_Hold_Time_per_Set` for 2 consecutive sessions, the app will reduce the `Recommended_Sets` by 1 or decrease the `Hold_Time_per_Set` by 1 second for the next session. A re-evaluation of `Max_Hold_Time_Achieved_Seconds` will be scheduled for the following week.

2.2. Dynamic Exercises (Accessory & Strength)

Input Variables: `Exercise_Name`, `Last_Performance_Reps`, `Target_Rep_Range`, `Last_Performance_Sets`, `Target_Sets`, `Last_Performance_Weight_Added_KG` (for weighted exercises), `Last_Performance_Rest_Time_Seconds`.

Logic Flow for Next Workout Calculation:

1. **Repetition Increase:** If `Last_Performance_Reps` is at the upper end of the `Target_Rep_Range` for 2 consecutive sessions, the app will increase the `Target_Reps` by 1 for the next session.
2. **Set Increase:** If the `Target_Reps` is consistently met for 2-3 consecutive sessions, the app will increase the `Target_Sets` by 1 (up to a maximum of 5 sets).

3. **Weight/Resistance Increase:** For weighted exercises (e.g., weighted pull-ups), if `Target_Sets` and `Target_Reps` are consistently met, the app will increase `Weight_Added_KG` by 1-2.5kg.
4. **Rest Time Decrease:** If `Target_Sets` and `Target_Reps` are consistently met, and no other overload variable (reps, sets, weight) is being increased, the app will decrease `Rest_Time_Seconds` by 15-30 seconds.
5. **Exercise Variation Progression:** Once `Target_Sets` and `Target_Reps` are consistently met with maximum `Weight_Added_KG` (if applicable) or minimal `Rest_Time_Seconds`, the app will suggest a harder variation of the exercise (e.g., from regular push-ups to Pseudo Planche Push-ups with a smaller lean angle).
6. **Volume/Intensity Adjustment (Regression):** If the user reports failure to meet `Target_Reps` for 2 consecutive sessions, the app will reduce `Target_Reps` by 1-2 or decrease `Weight_Added_KG` by 1-2.5kg for the next session.

2.3. Micro-Progression Specifics for Key Exercises

- **Resistance Bands (for assisted skills):**
 - **Progression:** The app will initially select a band that allows the user to perform 10-15s holds in the desired progression. When the user can consistently hold for 15s for the `Recommended_Sets`, the app will suggest using a thinner band (less assistance) for the next session.
 - **Regression:** If hold times drop significantly below the target, the app will suggest using a thicker band.
- **Pseudo Planche Push-ups (PPPU):**
 - **Progression:** The app will track the `Lean_Distance` (distance from hands to feet, or shoulder-to-wrist distance). When `Target_Reps` and `Target_Sets` are met, the app will decrease `Lean_Distance` by 1 cm for the next session, thereby increasing the lean and difficulty. This should be a visual slider or input field.
 - **Regression:** If `Target_Reps` are not met, the app will increase `Lean_Distance` by 1 cm.
- **Weighted Vest (for basic strength exercises):**
 - **Progression:** For exercises like push-ups or pull-ups, once the user can perform 12-15 reps for 3-4 sets, the app will suggest adding 1-2kg to the weighted vest. The app will then reset the `Target_Rep_Range` to 6-8 reps and progress from there.

2.4. Eccentric Prilepin Table (Negatives)

Max Eccentric (s)	Eccentric Time per Rep (s)	Total Volume (s)	Recommended Sets
3 - 6s	2 - 4s	12 - 18s	4 - 6
7 - 12s	5 - 8s	20 - 26s	3 - 5
13 - 20s	9 - 13s	27 - 36s	3 - 4

Logic: Focus on slow, controlled descent. When 3 sets of 10s eccentrics are achieved with 3-4 minutes rest, the app should indicate the user is likely ready to attempt the concentric (full) version of the exercise.

3. Weekly Schedule & Deload Protocol

- **Training Frequency:** 3-4 sessions per week. The app will generate a schedule alternating between Planche-focused and Front Lever-focused days, or combined sessions with adequate rest periods (3-5 minutes between skill attempts).
 - **Example Split:** Day 1 (Planche Focus), Day 2 (Front Lever Focus), Day 3 (Rest/Active Recovery), Day 4 (Planche Focus), Day 5 (Front Lever Focus), Day 6 & 7 (Rest/Active Recovery).
- **Session Structure:** Each session generated by the app will include:
 1. **Dynamic Warm-up** (5-10 min): Joint rotations, light cardio, and specific mobility drills relevant to the day's focus.
 2. **Skill Work** (20-30 min): 2-3 Planche progressions and 2-3 Front Lever progressions, with parameters determined by the progressive overload logic above. Focus on 3-5 sets of 5-15s holds.
 3. **Accessory Strength** (20-30 min): 3-4 exercises targeting weak points and overall strength, with parameters determined by the progressive overload logic for dynamic exercises. Focus on 3-4 sets of 6-12 reps.
 4. **Core Work** (5-10 min): 2-3 core exercises (e.g., L-sits, hollow body holds, hanging leg raises).
 5. **Cool-down** (5-10 min): Static stretches and mobility work.
- **Deload Weeks:** Every 4th week will be a deload week, automatically programmed by the app.
 - **Volume Reduction:** Reduce total sets/reps by 50% for all exercises.

- **Intensity Reduction:** Reduce hold times by 20% for isometric holds, or use easier variations/lighter weights for dynamic exercises.
- **Focus:** Active recovery, technique refinement, and mental break.

4. Exercise Selection for Skill Strength & Athletic Physique

The app will select exercises from the following categories, dynamically adjusting based on the user's progression and identified weak points. The app should prioritize bodyweight variations and resistance bands given the user's home training constraints.

- **Planche-Specific (Focus on pushing strength, shoulder protraction, triceps, core):**
 - Pseudo Planche Push-ups (PPUs): Various angles and hand positions.
 - Planche Leans: Progressing depth and lean angle.
 - Weighted Dips: If external weight is available (or harder bodyweight variations).
 - Overhead Triceps Extensions: Bodyweight or weighted.
 - Scapular Push-ups/Protraction exercises.
 - Core Work: L-sits, V-ups, hollow body holds.
- **Front Lever-Specific (Focus on pulling strength, back, biceps, core, shoulder retraction):**
 - Front Lever Rows: Various tuck positions (advanced tuck, one-leg, straddle).
 - Ice Cream Makers.
 - Weighted Pull-ups: If external weight is available (or harder bodyweight variations like archer pull-ups).
 - Straight Arm Pulldowns: Using resistance bands or a low bar.
 - Bicep Curls: Bodyweight or weighted.
 - Scapular Pulls/Retraction exercises.
 - Core Work: Dragon Flags (if equipment allows), hanging leg raises, hollow body holds.

5. Mobile-First User Interface & Feedback Loop Requirements

The AI app must provide an intuitive and interactive interface for the user to log their performance and receive feedback, optimized for mobile screens:

- **Minimalist Dashboard:** A clean home screen showing current stage for Planche and Front Lever, next workout, and overall progress bars.

- **Single-Tap Logging:** For each set, allow users to log hold time (via timer or quick input), reps (via +/- buttons or quick input), and RPE (1-10 slider/buttons).
- **Visual Progress:** Clear, engaging charts and graphs visualizing progress over time for key metrics (e.g., max hold times, reps, lean angles, weight added). These should be easily accessible but not clutter the main workout view.
- **Form Guidance:** For each exercise, the app will display concise form cues (text and/or short video links) that are easily accessible during the workout.
- **Pain Monitoring:** A simple "Report Pain" button. If pressed, the app will suggest regressing the exercise, reducing intensity, or taking a rest day, and provide guidance on seeking professional advice if pain persists.
- **No Clutter:** Avoid social features, news feeds, or other distractions. The app is a dedicated training tool.

6. Output Format

The AI app should generate a detailed, day-by-day training plan presented in a clear, easy-to-follow web-based interface. Each workout day should list:

- Warm-up routine.
- Skill exercises with target sets, reps/hold times, and rest periods.
- Accessory exercises with target sets, reps, and rest periods.
- Core exercises.
- Cool-down routine.
- Concise notes on form or specific cues for each exercise.

This comprehensive prompt provides the necessary technical detail for an AI to construct a highly effective, personalized, and mobile-optimized 2.5-year training program, ensuring the user achieves and masters the Full Planche and Full Front Lever.
